

EduPro Course Demand & Revenue Forecasting

Executive Summary

EduPro has historically planned new courses, pricing, and instructor hiring based on intuition rather than data. This project built predictive models using EduPro's course, instructor, and transaction history to forecast course enrollment and revenue in advance, giving the business a quantitative tool to support these decisions going forward.

Key Findings

- Free and paid courses behave very differently: free courses (63% of the catalog) drive high enrollment but no direct revenue, while paid courses generate meaningful revenue at lower volume. These should be treated as two distinct levers, not a single pricing scale.
- Course quality signals - rating and duration - along with subject category, are stronger predictors of enrollment than price. Discounting alone is unlikely to be the most effective way to drive demand.
- Revenue is highly predictable from price and enrollment (our models explain over 96% of revenue variation). Enrollment itself is harder to predict precisely with the current data, correctly reflecting that only 60 courses' worth of history exists today - forecasts should be used as directional guidance, not exact targets, until more course history accumulates.
- Instructor quality (experience and rating) meaningfully influences enrollment, suggesting instructor vetting and support is a worthwhile investment area.

Recommendations

- Consider a freemium pricing structure that converts free-course engagement into paid upgrades, rather than treating free and paid courses as separate product lines.
- Invest in course quality (content, structure, instructor support) as a primary demand driver, ahead of price-based promotions.
- Continue to track and expand instructor quality metrics, since instructor rating and experience are measurable levers tied to enrollment outcomes.
- Use the accompanying dashboard as a planning tool for new course proposals, while continuing to collect more course history to sharpen forecast accuracy over time.

Deliverables

This work is supported by a full research paper (methodology and detailed results), a live interactive dashboard for forecasting new course scenarios and comparing categories, and this summary for stakeholder review.
